Concepts in Cultural Geography

The study of human activities from a spatial perspective

Created by Linda Hammon, Teacher Consultant

http://www.geo.txstate.edu/tage/
Cultural Geography

the study of human activities from a spatial context

NATURE AND PERSPECTIVES OF GEOGRAPHY

- Human Geography: the study of human activities from a spatial context
- Basic Ideas of Geography:
  - All places have location, direction, and distance with respect to other places
  - Places may be large or small; the scale is important
  - Places have both physical structure and cultural content
  - The characteristics of places develop and change over time
  - The elements of places interact with other places
  - The content of a place is rationally organized
  - Places may be classified into regions with similarities and differences

LOCATION
- Position on the Earth’s surface.
- Absolute Location:
  - The exact position of a place
  - Latitude and longitude – used to describe a point on earth in reference to degrees, minutes, and seconds
- Relative Location:
  - The position of a place in relation to the position of another place
  - Conveys interconnection and interdependence between different places
- Site:
  - Describes the physical and cultural characteristics of a location
- Situation:
  - Describes where a location is in reference to surrounding features in the larger region
- Scale:
  - Relationship between the size of a feature as depicted on a map and the size of the feature in actuality

The 4 Traditions of Geography
- American Perspectives:
  - Spatial Tradition
    - Emphasis on movement and location
    - Deals with the shape of the land

Area Studies Tradition
- Emphasis on region, place and history
- Deals with physical and cultural characteristics
- Man-Land Tradition
- Emphasis on the relationship between external conditions and human actions
- Overlaps with the Area Studies Tradition
- Earth Science Tradition
- Emphasis on geology
- Deals with how physical systems affect humans (hydrological cycle, wind patterns, etc)

Maps and Map Types
- Map: a two dimensional representation of variables on the earth’s surface
- Thematic Map: represents a single variable over an area
  - Dot
  - Choropleth
  - Isoline
  - Symbol

Region:
- an area with unifying characteristics
- Formal: an area that can be identified by its homogeneous cultural or physical characteristics
- Functional: an area in which there is a center from which social or economic activities spread
- Perceptual: an area not defined by any set of physical data, but by human conception of the area

BASIC GEOGRAPHIC MODELS & CONCEPTS

Cultural Change Theories
- Environmental Determinism: belief that the physical environment is solely responsible for shaping human actions and behaviors.
- Possibilism: belief that people, and not the environment, are the forces responsible for shaping culture.

Economic Development Models
- Rostow Model 1950s: gauge of economic development, based on western point of view. Contains 6 stages of development.
  - Traditional Societies
  - Preconditions for Takeoff
  - Takeoff
  - Drive to Maturity
  - Age of Mass Consumption
  - Post Industrial (theoretical/debatable)
- World Systems Model 1970s: as opposed to the ROSTOW MODEL, this model looks at economic development based on the relationships between countries – the core consists of the economically dominant partners; the sub-periphery and periphery are less dominant and typically contain more basic level employment; they are reliant upon the core.

Economic Sectors
- Primary Sector: agricultural and extractive activities. Relied upon by many developing nations.
- Secondary Sector: processing activities – manufacturing, construction and power production. Many developing nations support secondary activities with lower labor costs than developed countries.
Tertiary Sector service activities. Many developed countries’ economies are dominated by tertiary sector jobs.

Quaternary Sector informational activities. The Quinary Sector is a new theoretical sector within the quaternary sector of high level management jobs.

Economic Spatial Models/Concepts

Gravity Model H. Carey; the laws of gravity are applicable in describing the attractive force that exists between two areas (cities). Large cities have greater drawing power for people than small cities. There is a breaking point for each city beyond which people will not be drawn to the city to meet their needs.

Distance Decay a term linked with the Gravity Model. Describes the decline of attractive pull something has with increasing distance from the point of origin.

Central Place Theory W. Christaller; 1930s; a central place is a market center used for an exchange of goods and services. People are attracted to a central place from the surrounding area. The competition between central places creates a regular pattern of settlements. Larger settlements are fewer and farther apart; they exist to provide a greater variety of services and specialized goods (the symphony, museums) that people are willing to travel a greater distance for.

Threshold minimum number of people needed to support a product or activity

Range distance people are willing to travel for a product or activity

Von Thunen’s Model J. H. von Thunen; 19th century; describes the relationship between distance from market and land use. There are four concentric rings around a central market. Products grown inside each of the rings are determined by the crop’s transport gradient. Perishable items like fruits and vegetables face higher transport rates, while the transportation rates for commodities like grain are less. In the 1st ring, dairying and market gardening occur since these products are perishable and generate high transport costs. The 2nd ring around the center produces cash grains and livestock. Mixed farming occurs in the 3rd ring, and extensive grain farming and stock raising occurs in the farthest ring.

Population Models/Concepts

Demographic Transition Model A model that evaluates economic development by examining population patterns. The model consists of 4 stages. Stage One is characterized by high birth rates and high death rates. In Stage Two death rates decline but there is still a high birth rate. In the third stage, birth rates also begin to decline as people begin to control family size. The fourth stage is characterized by very low birth and death rates with only a slight percentage of total population increase, if any. This model is based primarily on countries that followed the European model of industrialization. Countries usually follow a linear, progressive path through the model. This model does not include immigration data.

Least-Cost Theory A. Weber; used to discover the optimum location of an industrial/manufacturing establishment. Weighs three basic expenses against each other to try to determine the best location: relative transport costs, agglomeration costs, and labor costs.

Geopolitical Theories

Concerned with strategic advantage and the balance of political, economic and military power on the earth’s surface.

Sea Power Theory Mahan; late 1800s; argued that control of the sea lanes would lead to national strength.

Heartland Theory MacKinder; early 1900s; based on land power. Believed that the best base for world domination would be the Eurasian Heartland.

Rimland Theory Spykman; 1944; based on coastal power. Reasoned that the best base for global conquest would be the Eurasian Rimland.

Place Utility when used in relation to

Migration the perception of a place

Economic the value of a good or service determined by transportation to a specific location where needed

Population Growth Theories

Malthus’ Theory

Population grows exponentially while its food supply grows linearly. A population is therefore limited by its food supply.

Checks that keep population in balance with subsistence methods are either "private" (moral restraint, celibacy) or "destructive" (war, pestilence, famine).

Neo-Malthusianism rose from Malthus’ original theory; consists of the advocacy of population control programs to preserve and improve general national prosperity and well-being.

Boserup’s Thesis E. Boserup; contradicts Malthusianism. States that, as a population increases, the necessity to produce more will be met using technology. Population growth forces an increase in technology in the farming industry.

Population Pyramid a graph that represents a population by age and sex. Population pyramids include immigration data.

Growth this shape indicates high birth and low death rates

Stability this shape indicates low birth and death rates

Decline this shape indicates low death rates and very low birth rates

Disruption this shape indicates irregular birth and death rates
Ravenstein’s Laws of Migration E.G. Ravenstein; 1970s-80s; a series of theoretical laws about migration. These laws include the following ideas:

- Most migrants travel only a short distance
- Most migration is rural to urban
- Most international migrants are young males
- Each migration flow produces a counterflow
- Most migration occurs in steps

Urbanization Models/Concepts

- Central Business District (CBD) centralized core of the city, generally center of finance and government
- Concentric Zone Model E. Burgess; 1923; a generalized model of urban growth and land use that varies slightly from the Sector Model. A city grows outward in a series of rings from the CBD (the 1st zone). The 2nd ring, around the CBD, is called the Zone of Transition (industry, poor housing); the 3rd is called the Zone of Working-Class homes (older homes, independent working-class). The 4th ring is called the Zone of Better Residence (middle class); the 5th ring is called the Commuter’s Zone, and it consists of people who work in the CBD but commute there from the outer edges of the city (suburbs).

- Sector Model H. Hoyt; 1939; a generalized model of urban growth and land use patterns. The CBD is in the direct center. Wholesale manufacturing and low class residential housing areas are located next to the CBD, but extend outward from it along a major transportation route. The outer edges are a mix of medium-class and high class housing.

- Multiple Nuclei Model C. Harris & Ullman; 1945; another generalized model of urban growth and land use patterns. The CBD is not in the exact center. The city spreads outward from more than one node of growth. There are several other small centers from which growth occurs. There is a CBD, a wholesale manufacturing area, a low-class residential area, a medium-class residential area, and an industrial suburb

Note: the models for urban areas defined above are based on United States cities; cities in other areas of the world have their own models

Population Geography

The study of population characteristics is defined as demography. This includes the growth, composition, and distribution of the population.

Population Concepts

- Net Population Growth number of deaths and the number of emigrants subtracted from the number of births added to the number of immigrants from a place per 1,000 people; it may be positive, negative, or zero
- Birth Rates (BR) number of live births per 1,000 people annually
- Infant Mortality Rate (IMR) number of deaths per 1000 live births of babies up to 1 year of age
- Death Rate (DR) number of deaths per 1,000 people annually
- Rate of Natural Increase (RNI) derived from subtracting crude death rate from the crude birth rate, does not account for immigration/migration
  - Replacement Level 2.1 RNI; the necessary level for a population to sustain itself but not grow or decline
  - Doubling Time the time it would take for the country’s population to double at its current RNI
- Total Fertility Rate (TFR) average number of children a woman will have during her reproductive years; assumes the same rate for all women of 15 to 50 years of age
- Dependency Ratio number of dependents (under 15 and over 65) to number of productive people (ages 15-65)
- Migration the movement from one location to another with the intent of staying in the new location
  - Step long distance relocation completed in stages
  - Chain pattern or path of movement from one location to another specific location initiated by (an) individual(s) and followed by others such as family, friends, or members of the community
  - Channelized pattern of movement generated over time between areas often characterized by economic and/or social connections
  - Counter migrants return to their point of origin
- Cohorts a group of people, usually of the same age or connected by some other time related characteristic
- Demographic Momentum population growth, due to an earlier baby boom, still seen when a population has reached replacement levels of fertility

Population Distribution, Density, and Overpopulation

- Eumene habitable areas on the earth’s surface; populated areas
- Noneumene uninhabitable areas of the earth’s surface, few people
- Most people live on a low-lying region of the world close to the 30°N latitudinal line. Population is concentrated in Europe and Southeast Asia (including China, Japan, and India)
- Carrying Capacity theoretical number of people a given area is able to support
- Overpopulation would occur if a population has exceeded the land’s carrying capacity
- Physiological Population Density people per unit of arable land
- Arithmetic Population Density people per unit of land

See POPULATION THEORIES/CONCEPTS, RAVENSTEIN’S LAWS OF MIGRATION, and POPULATION GROWTH THEORIES in the Models/Concepts Section

Cultural Geography

Cultural Geography analyzes the spatial context of cultures. This includes language, religion, hearths, folk and pop culture, and the human imprint on the land.

Ethnocentrism believing one culture (usually one’s own) is superior and all other cultures must follow its example

Humans and Culture

- Culture a people’s way of life; developed by a people to meet its fundamental needs
- Cultural Pluralism two or more groups that follow different ways of life within the same region
- Cultural Hearth
  - Early region of cultural innovation
  - Origin point; ideas diffuse from this origin to other places around the world

Cultural Components

- Culture Traits units of learned behavior ranging from the language spoken to the tools used or the games played
- Culture Complex individual cultural traits that are functionally interrelated
Culture Region a portion of the earth’s surface occupied by populations sharing recognizable and distinctive cultural characteristics; basic spatial unit of culture; subjective term

Culture Realm a set of culture regions showing related culture complexes and landscapes

Cultural Ecology study of the relationship between a culture group and the natural environment it occupies

Landscape Transformation when people alter, improve, or destroy the landscape
  - Cultural Landscape the imprint of human activity on the land

Roots of Culture almost all culture originated in that of the hunter gatherers

Cultural Diversity result of different people moving through different stages of development in different areas at different times
  - Hunters and gatherers gradually became sedentary after the Neolithic Revolution, and societies became predominantly urban after the Industrial Revolution

Cultural Structure/Integration the interlocking nature of all aspects of a culture

Non-Material Culture oral traditions, songs, beliefs that are representative of a culture
  - Ideological Subsystem ideas, beliefs, and knowledge that builds the ethical and moral base of a culture
    - Mentifacts abstract belief systems from the ideological subsystem that are passed down
  - Sociological Subsystem the cultural expected patterns of personal relations and class rankings, dependent on a variety of factors and that culture’s values
    - Sociofacts define the social organization of a culture; part of the sociological subsystem

Material Culture objects shaped or created and used that represent a culture
  - Technological Subsystem the material objects that, together with the techniques for their use, enable a culture to survive
  - Artifacts tools and other instruments dealing with the Technological Subsystem

Cultural Convergence sharing of artifacts, mentifacts, and sociofacts between two cultures

Culture Change
  - Cultural Lag when a culture is slow to respond/adapt to changing circumstances
  - Spatial Diffusion method by which cultural elements are spread (2 types)
    - Relocation Diffusion element is physically and usually intentionally carried from one region to another as a result of migration
    - Expansion Diffusion the element spreads to other areas but remains strong in its birth region (3 types)
      - Contagious Diffusion the element spreads uniformly outward from its source region
      - Hierarchical Diffusion process of spreading the element through tiers
      - Stimulus Diffusion
  - Diffusion Barriers conditions that hinder either the flow of information or the movement of people
  - Acculturation adopting some or all of the characteristics of another dominant culture
  - Syncretism fusing old and new parts of culture together

Cultural Concepts/Ideas
  - Folk Culture heritage of static, traditional customs of culture, usually specific to a certain group; tends to divide people from one another
  - Popular Culture dynamic culture of a mass of people; tends to unify people
  - Language organized method of spoken, and usually written, communication
    - Dialect recognizable speech variant from the standard version of a language
    - Pidgin a simple mixture of basic elements of two (or more) languages
    - Creole a pidgin that has evolved to take on more complex grammar and syntax; it has also become the first language of a group
    - Lingua Franca established language used for communication between people with incomprehensible native languages
  - Religion a system of worship of a divine entity, usually contains moral/ethical systems within it
    - Universalizing Religion faiths that are applicable to all humans; a religion that actively seeks converts. ex) Buddhism, Christianity, Islam

Ethnic Religion may be recognized as both a religion and an ethnic group ex) Hinduism, Judaism, Shintoism

See CULTURAL CHANGE THEORIES in the Models Section

Political Geography

Political Geography the spatial study of the organization and distribution of political phenomena (boundaries, voting patterns, distribution of wealth)

Nations and States
  - Nation a group of people with unifying cultural characteristics and a perceived homeland
  - State a sovereign political unit with government and boundaries recognized by outsiders
  - Nation-State a state that spatially coincides with a nation
  - Centripetal Forces unify the people of a state
    - Nationalism loyalty and identification with one nation or state and its goals, above all others
    - Centrifugal Forces promote division within a state
      - Regionalism identification with a minority group and region rather than a state
  - Colonialism rule by an outside power; can be direct or indirect.

State Shapes
  - Compact ex) Uruguay
  - Fragmented ex) Maldives
  - Prorupted ex) Thailand
  - Perforated ex) South Africa
  - Elongated ex) Chile

Political Regions and Organizations
  - Core Area a state’s foremost center of population, transportation, and economic activity
  - Unitary State country with a centralized government and cultural homogeneity
  - Federal State country made up of several equal provinces with strong regional governments
  - Forward-Thrust Capital a capital deliberately sited away from a state’s core to encourage uniform development
  - International Organization a group of associated states whose jurisdiction is secondary to the governments of each individual state
  - Supranational Organization a group of associated states whose jurisdiction supersedes that of each individual state
Shatter Belt region under continuous stress due to aggressive political or cultural rivalries

Choke Point a narrow area such as a strait or an isthmus where people or resources may bottleneck, leading to conflict

Enclave a foreign territory that perforates a larger state

Exclave an outlying portion of one state, usually inside another country

Boundaries

Natural Boundaries based on recognizable, natural features of the earth’s surface

Artificial (Geometric) Boundaries partitions that tend to take the form of a straight line

Antecedent Boundary drawn before the cultural landscape is put into place

Subsequent Boundary drawn after the cultural landscape was put into place

Consequent Boundary partition drawn to accommodate cultural or economic differences between countries.

Superimposed Boundary forced onto a populated area by an outside power that is unconcerned with preexisting divisions

Relic Boundary nonfunctional former partition still marked by landscape features or differences

See GEOPOLITICAL THEORIES in the Models Section

AGRICULTURAL GEOGRAPHY

Agricultural Revolutions

Neolithic Revolution marked by the domestication of animals and the planting and tending of plants

2nd Agricultural Revolution began in Europe with the use of the 3 field system, crop rotation, introduction of new plants to Europe from the Americas and improved technology

3rd Agricultural Revolution

Green Revolution the use of hybrid seeds, improvements in management, and technology in order to increase yields

Biotechnology the alteration of DNA/genetic engineering on crops and livestock to increase production levels

Rural Agriculture: the growing of crops or livestock either for subsistence, or for market sale

Subsistence Agriculture: growth of crops in order to sustain oneself

Extensive Subsistence Agriculture: involves large plots of land, and small amounts of labor

Intensive Subsistence Agriculture: involving smaller plots of land, using a large labor force in an attempt to increase yield

Nomadic Herdmg: migration to allow livestock to feed by foraging

Shifting Cultivation (Slash & Burn, Swidden): clearing of large plots of forest in order to farm on it

Commercial Agriculture: farming in order to sell yields for profit

Intensive Commercial Agriculture: farming that uses small amounts of technological and scientific input for each plot of farmland. Generally applied to crops which have high yields, and a high market demand (fruit, vegetables, dairy)

Extensive Commercial Agriculture: large amounts of land that are not intensively worked upon (wheat, livestock)

Agribusiness: farms as part of corporate units; farms produce for a specific market and are often part of a vertically integrated business; usually leads to the concentration of certain farming activities in specific regions

Collective Farms: cooperative farming in which producers lose their land, and join large numbers of workers in order to perform different jobs within the collective for the good of the order

State Farms: government-owned farms, run by employees of the state

Settlement Patterns: how people have organized villages and towns in order to engage in agriculture or land survey systems

Clustered Village

Linear/Street Village

Village with Commons

Irregular Village

Checkerboard Village

Long-Lots: settlement pattern used by the French and Spanish to allow all lots access to a waterway or road

Metes and Bounds: system that makes use of natural features to set boundaries, causing very few regular boundaries to be formed

Township/Range System: land survey system instituted by the United States and Canada where land was surveyed and divided up using a grid system; provided and orderly way to divide and sell land in the West for settlement

See POPULATION GROWTH THEORIES and ECONOMIC THEORIES in the Models Section

INDUSTRIALIZATION AND DEVELOPMENT

Industrialization: the industrial revolution began in the United Kingdom in late 1700s. The root of industrialization was technology. It began with the textile industry. Before the Industrial Revolution manufacturing took the form of cottage industry (manufacturing in the individual home).

Agglomeration: concentration of production or businesses in one area for mutual benefit

Deglomeration: businesses or industries leave an area where they had been concentrated due to technology, increased costs, or competition

Comparative Advantage: a business will produce goods and services that have the greatest ratio of advantage for that area in comparison to other areas; this is based on the assumption that free trade exists

Bulk-Reducing Industry: economic activity in which the final product weighs less than its inputs

Bulk-Gaining Industry: economic activity in which the final product weighs more than its input

Labor Intensive Industry: industry where labor costs are a higher percentage of expense

Fordist Industries: industries where each person is assigned a specific task in an assembly line. Ford was one of the first companies to organize its production in this way early in the twentieth century.

Post Fordist Industries: industries where relatively skilled workers master a wide variety of tasks

Market Equilibrium: the price at which the supply equals the demand

Ubiquitous Industries: businesses that are distributed in direct proportion to the distribution of the population

Break of Bulk Point: the location at which a good is transferred from one mode of transportation to another

Line-Haul Costs: transportation costs for a good

*indicates a "per capita" measure

- **Transnational Corporations** (Multinational corporations) operates factories in countries other than the one in which its main headquarters are located.
- **Trading Bloc** group of countries near each other that promote trade amongst themselves; barriers may be placed on other trading blocs.
- **Development** a comparative term measuring the extent to which a country's raw materials have been fully utilized/developed.
- **PPP (Purchasing Power Parity)** number used by the World Bank; measures value of a country's money in relation to what can be purchased with that amount.
- **GDP (Gross Domestic Product)** measures the total value of goods and services produced within a country in a year.
- **GNP (Gross National Product)** measures the total value of goods and services produced by individuals and businesses from a country within a year regardless of whether the individual or business is operated within that country.
- **Literacy Rate** measures percentage of people who can read and write.

**ECONOMIC SECTORS in the Models Section**
- Additionally, see the DEVELOPMENT INDICATORS CHART above.

**CITIES AND URBAN LAND USE**

- **City/Town** a cluster of people in a "nucleated settlement." A city contains a Central Business District, residential sectors, and, depending on the city, commercial sectors, government sectors, and industrial sectors. Cities perform functions. They interact with the region around them and other cities; additionally, their location is often politically, economically, or socially strategic. For example, cities located at break-of-bulk points take advantage of the economic options of the area.

- **Conurbation (Megalopolis)** a series of cities that have grown into one urban area over time.
  - Ex) Washington D.C. – Boston corridor
  - Suburb a residential, industrial, or commercial –specialized area of a city that is reliant upon other sectors of the city; it is not self-sufficient.

**Economic Base**
- **Basic Sector** the production of goods or services within the city that are exported outside the city.
- **Nonbasic Sector** production of a service for residents within the city, responsible for city maintenance.

**RESOURCE ISSUES**

- **Conservation** is the sustainable use and management of a natural resource through consuming it at a less rapid rate than it can be replaced.
- **Preservation** is maintenance of a resource in its present condition with as little human impact as possible.
- **Sustainable development** a level of development that can be maintained in a country without depleting resources to the extent that future generations will be unable to achieve a comparable level of development.
- **Biodiversity** is the number of species within a specific habitat.
- **Resource** is a substance in the environment that is useful to people, is economically and technologically feasible to access, and is socially acceptable to use.
