

Exponential Government: The Future of Public Service in an Exponential Era

The world we knew is changing at exponential speed. The iPhone has eclipsed the Blackberry, mobile devices have displaced PCs, and the cloud is radically challenging long held assumptions about the data center. And what we regard as state of the art today will look quaint tomorrow. Exponential technologies are unlocking individual, organizational, and societal potential. Along the way, people get scared, old organizational models crumble, and legacy cost structures stop penciling out.

Understanding these shifts is important - knowing how exponential shifts are different than the last big change is vital to doing the public's business. This session will provide an interactive tour of the meta-trends that are reshaping the communities that government serves - demographics, economics, methods of work, expectations of community, and the relevance of governmental institutions.

Dustin will sketch out what Exponential Government will look like, how will it act, and how what you are doing today can lead you to a preferred, exponential future that is worthy of our children - and contributes in big and little ways, to a more perfect union.

Dustin Haisler, Chief Innovation Officer, e.Republic
